

How to migrate to a plesk server using plesk migrator

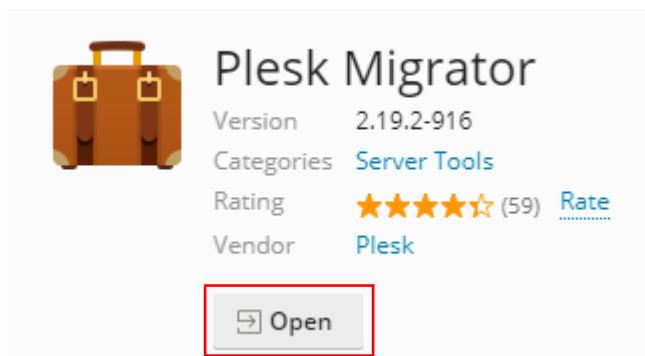

Go onto plesk and click extensions:

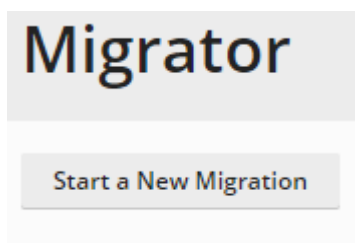

Search for plesk migrator:

Install it then open it:

Click on start migration:

Fill in your old server settings and prepare the migration:

Panel type

 ☒ Plesk for Linux

 ☐ cPanel

 ☐ Confirx

 ☐ Pro Control Panel

 ☐ DirectAdmin

IP Address * 
IP address of the source server

Root login *

Authorization * ☒ User / password
☐ SSH keys

Root Password * 

SSH port *

Temp directory *

* Required fields

Prepare migration

Cancel

Then select everything you want to move over and click migrate:

Migrate by ☒ Subscription ☐ Customer ☐ Reseller ☐ Hosting Plan

☐ Show existing subscriptions
The only subscriptions will be migrated that are selected in the current active tab

Subscriptions

Available:

☐
☐ example.com
☐ example.com
☐ example.com
☐ example.com
☐ example.com
☐ example.com
☐ example.com

Click the objects or use checkboxes

Selected:

☐

☒ Migrate mail messages

☒ Migrate website files

☒ Migrate database data (tables, rows, etc)

Regardless of these options, which are related to migration of content only, migrator will restore all objects (customers, resellers, subscriptions, add-on domains, subdomains, mailboxes, databases, database users, etc) and their settings for selected domains.

☒ Copy to source customer/reseller
If customer/reseller does not exist on the target server, it will be created

☐ Reassign to

Migrate

Cancel

Now it should give you a list of errors, you will need to install some extensions to match it with the old server as best as possible then when you are happy with everything you have done click to rescan then once you are happy start the migration and you will have a page similar to this:

[Overview](#) [List of subscriptions](#) [Log](#)

Source server: subscriptions 3, service plans 4, customers 0, resellers 0

All 3 subscriptions have been migrated
You can now alter the DNS records to point to the destination server

Migrations queue - 0

This migration is taking place, wait for this to finish it may take a bit of time. Once done then click finish migration:

[Settings](#) [Reload source data](#) [Finish migration](#)

That should be your migration complete now you may just need to do some configuration.
