

Old 1&1 Dynamic Cloud Servers

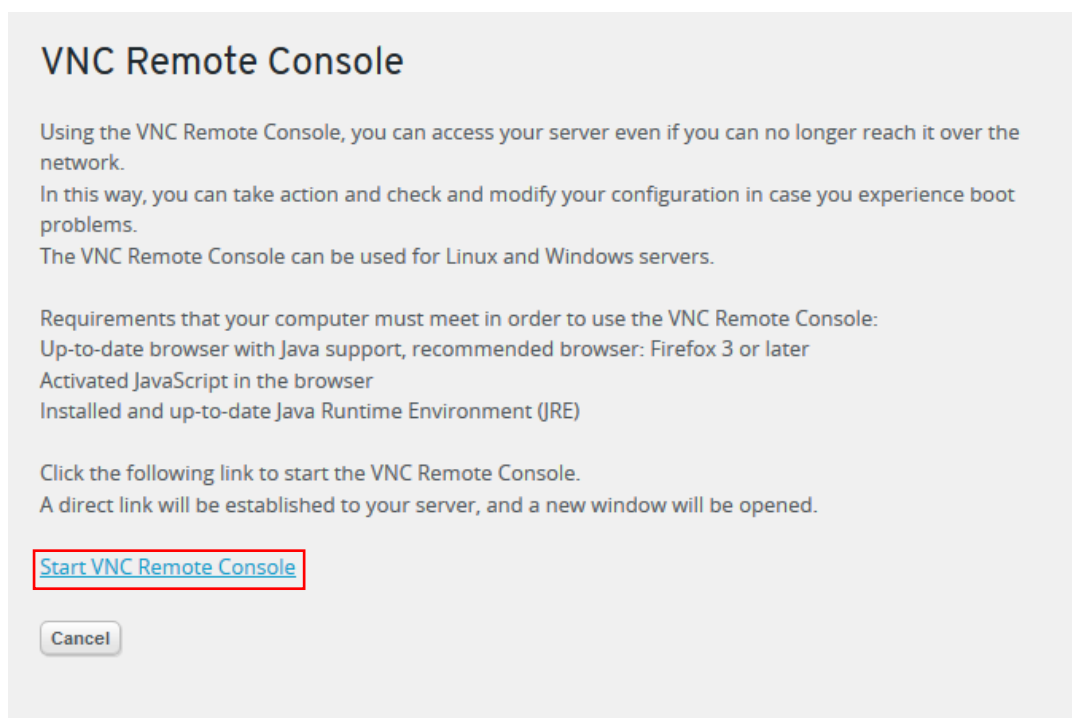

Accessing VNC

Go to the server in control panel click on VNC:

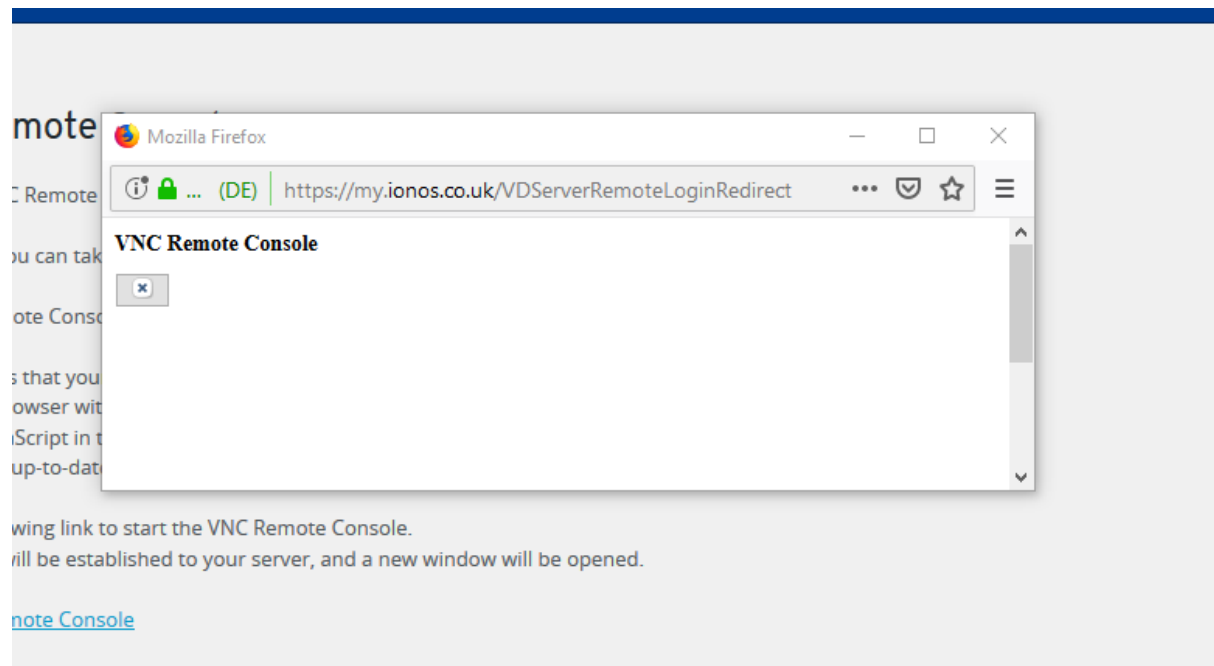

The screenshot shows the 'Servers & Cloud' control panel. On the left, under 'Server Administration', there is a list of options: 'Server Access Data', 'Server Control', 'Hardware Configuration', 'Server Re-image', 'Server Monitoring', 'Firewall', and 'IP Address Overview'. Below this, under 'More Features', are 'FTP Storage', 'Recovery Tool', and 'VNC Remote Console', which is highlighted with a red rectangle. On the right, there is a 'Cloud Server' section titled 'Configure Your Own Cloud Server' with a description and a 'Select a Configuration' button. At the bottom left, there is a blue banner for 'Cloud Backup' with the text 'Never fear data loss again' and a 'Select your backup storage now' button.

Click start VNC Remote Console:

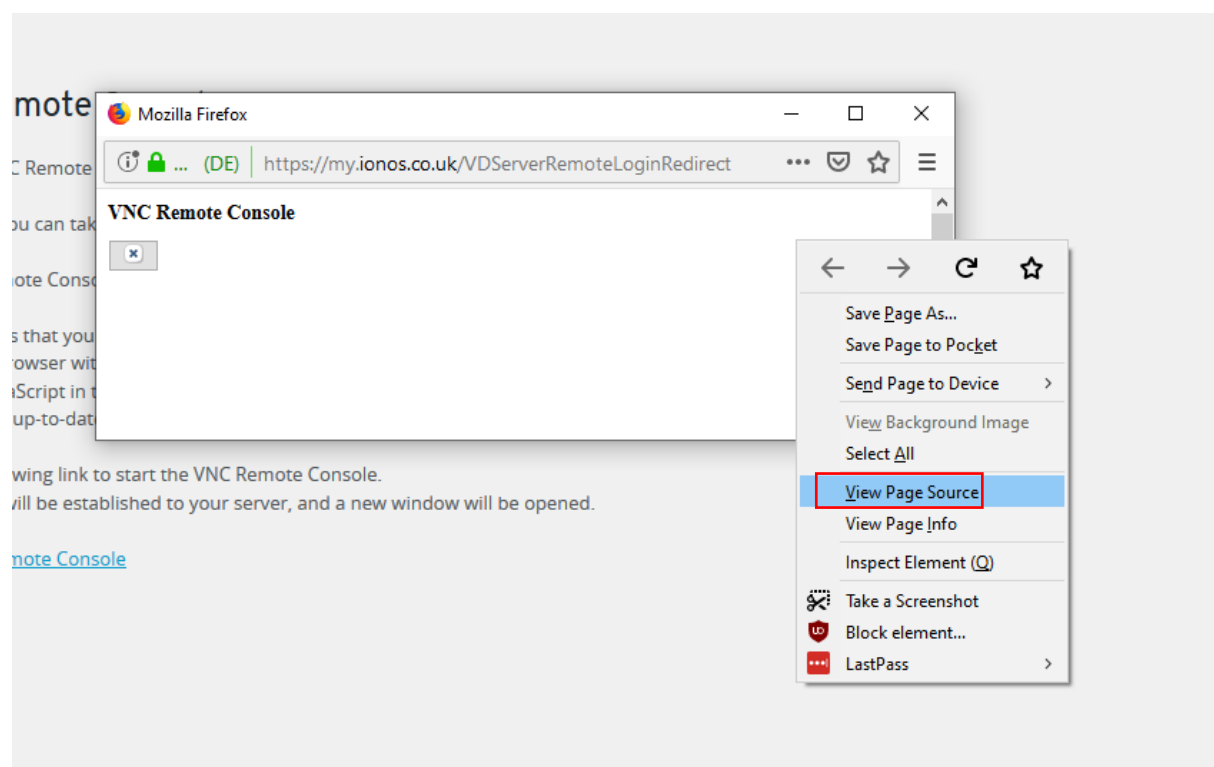

The screenshot shows the 'VNC Remote Console' page. It has a heading 'VNC Remote Console' and a paragraph explaining that it allows access to the server even if it's unreachable over the network. It mentions that configuration can be checked and modified in case of boot problems and that it can be used for Linux and Windows servers. Below this, it lists requirements: 'Up-to-date browser with Java support, recommended browser: Firefox 3 or later', 'Activated JavaScript in the browser', and 'Installed and up-to-date Java Runtime Environment (JRE)'. It then provides instructions to click a link to start the console, noting that a direct link will be established and a new window will open. A link labeled 'Start VNC Remote Console' is highlighted with a red rectangle. At the bottom left, there is a 'Cancel' button.

This will open up a new window like this:

Right click and click view page source

This will open up the page source, not press on your keyboard: Ctrl+f

This will open a find field and type in, password. Here you will have the VNC connection info:

```
value="xvp.onlinehome-server.info"><param name="port" value="5901"><param name="password" value="
```

This is the useful information to use.

You have the hostname: xvp.onlinehome-server.info

The port number: 5901

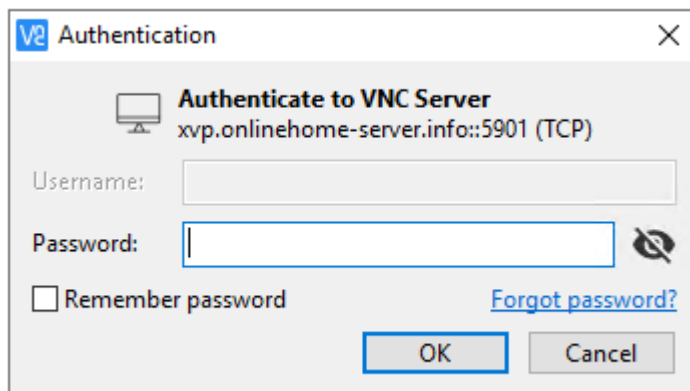

And the password: this will be found where the red box it, but is redacted here for security reasons.

DO NOT CLOSE ANY OF THE TWO WINDOWS OPENED FROM THE VNC PROCESS AS IT WILL CLOSE VNC

Go to your VNC client, I will use VNC Viewer and input the hostname:port

This will take a few seconds to load, then it will ask for the password:

Put the password in and you will be connected.
